CPA Equation of State

Compressibility Factor

The density of the mixture can be obtained from the compressibility factor, which can be derived from the residual Helmholtz free energy:

$$Z = 1 - \frac{v}{RT} \left(\frac{\partial A^r}{\partial V} \right)_{T, N_i}. \quad (\text{S1})$$

The compressibility factor can be divided into terms representing different interactions. We also add a term related to the change in the relative permittivity (perm), which is from the DH and Born term (more details on the origin of this term are presented afterward):

$$Z = Z^{\text{phys}} + Z^{\text{assoc}} + Z^{\text{DH}} + Z^{\text{Born}} + Z^{\text{Perm}}. \quad (\text{S2})$$

The compressibility factor expression for the physical term is given by:

$$Z^{\text{phys}} = \frac{Z}{Z - B} - \frac{A}{Z + B}, \quad (\text{S3})$$

where A and B are the dimensionless SRK parameters:

$$A = \frac{aP}{R^2 T^2}, \quad (\text{S4})$$

$$B = \frac{bP}{RT}. \quad (\text{S5})$$

The association expression for the compressibility factor is given by:

$$Z^{\text{assoc}} = \frac{1}{2} \left(1 + \frac{\eta}{g_\eta} \frac{dg_\eta}{d\eta} \right) \sum_i x_i \sum_{A \in i} (\chi_{A_i} - 1). \quad (\text{S6})$$

In the DH and Born terms, we split them into a contribution at fixed relative permittivity

and varying relative permittivity, which originates Z^{Perm} :

$$-\frac{v}{RT} \left(\frac{\partial A^{\text{DH}}}{\partial V} \right)_{T, N_i} = -\frac{v}{RT} \left(\frac{\partial A^{\text{DH}}}{\partial V} \right)_{T, N_i, \epsilon_r} - \frac{v}{RT} \left(\frac{\partial A^{\text{DH}}}{\partial \epsilon_r} \right)_{T, V, N_i} \left(\frac{\partial \epsilon_r}{\partial V} \right)_{T, N_i}, \quad (\text{S7})$$

$$Z^{\text{DH}} = -\frac{v}{RT} \left(\frac{\partial A^{\text{DH}}}{\partial V} \right)_{T, N_i, \epsilon_r} = \frac{v}{4\pi N_A \sum_j x_j z_j^2} \sum_j x_j z_j^2 \left[X_j - \frac{\kappa^3}{2(1 + \kappa \sigma_j)} \right], \quad (\text{S8})$$

$$-\frac{v}{RT} \left(\frac{\partial A^{\text{Born}}}{\partial V} \right)_{T, N_i} = -\frac{v}{RT} \left(\frac{\partial A^{\text{Born}}}{\partial V} \right)_{T, N_i, \epsilon_r} - \frac{v}{RT} \left(\frac{\partial A^{\text{Born}}}{\partial \epsilon_r} \right)_{T, V, N_i} \left(\frac{\partial \epsilon_r}{\partial V} \right)_{T, N_i}, \quad (\text{S9})$$

$$Z^{\text{Born}} = -\frac{v}{RT} \left(\frac{\partial A^{\text{Born}}}{\partial V} \right)_{T, N_i, \epsilon_r} = 0, \quad (\text{S10})$$

$$Z^{\text{Perm}} = -\frac{v}{RT} \left[\left(\frac{\partial A^{\text{DH}}}{\partial \epsilon_r} \right)_{T, V, N_i} + \left(\frac{\partial A^{\text{Born}}}{\partial \epsilon_r} \right)_{T, V, N_i} \right] \left(\frac{\partial \epsilon_r}{\partial V} \right)_{T, N_i}, \quad (\text{S11})$$

$$Z^{\text{Perm}} = - \left[\frac{\kappa^2}{8\pi N_A c \epsilon_r \sum_j x_j z_j^2} \sum_j \left(\frac{\kappa x_j z_j^2}{1 + \kappa \sigma_j} - \frac{x_j z_j^2}{R_{B,j}} \right) \right] V \left(\frac{\partial \epsilon_r}{\partial V} \right)_{T, N_i}. \quad (\text{S12})$$

We, therefore, need an expression for the variation of the dielectric constant with volume.

Fugacity Coefficient

When two phases are in equilibrium, temperature, pressure, and fugacity of each component in both phases are equal. In terms of chemical equilibrium, the fugacity equality of component i between phases I and II is given by:

$$x_i^I \phi_i^I = x_i^{II} \phi_i^{II}, \quad (\text{S13})$$

where ϕ_i is the fugacity coefficient of component i , which can be derived from the residual Helmholtz free energy as:

$$\ln \phi_i = \frac{1}{RT} \left(\frac{\partial A^r}{\partial N_i} \right)_{T, V, N_j} - \ln Z. \quad (\text{S14})$$

Similarly to the compressibility factor, the fugacity coefficient can be divided into terms representing each one of the interactions:

$$\ln \phi_i = \ln \phi_i^{\text{phys}} + \ln \phi_i^{\text{assoc}} + \ln \phi_i^{\text{DH}} + \ln \phi_i^{\text{Born}} + \ln \phi_i^{\text{Perm}}. \quad (\text{S15})$$

Separating the relative permittivity contribution as done in the compressibility factor, the expressions for the physical, association, DH and Born and relative permittivity fugacity coefficients are given, respectively, by:

$$\begin{aligned} \ln \phi_i^{\text{phys}} = & -\ln(Z - B) + \frac{B_i}{B} \left(\frac{B}{Z - B} - \frac{A}{Z + B} \right) \\ & - \left\{ \frac{A_i}{B_i} + \frac{1}{B \ln 2} \left[B_i \frac{g^{E\infty}}{RT} - \sum_j x_j \left(B_i \frac{\Delta U_{ij}}{RT} + B_j \frac{\Delta U_{ji}}{RT} \right) \right] \right\} \ln \left(1 + \frac{B}{Z} \right), \end{aligned} \quad (\text{S16})$$

$$\ln \phi_i^{\text{assoc}} = \sum_{A \in i} \eta_{A_i} \ln \chi_{A_i} + \frac{B_i}{8g_\eta Z} \frac{dg_\eta}{d\eta} \sum_j x_j \sum_{A \in j} (\chi_{A_j} - 1), \quad (\text{S17})$$

$$\ln \phi_i^{\text{DH}} = \frac{z_i^2 v}{4\pi N_A \sum_j x_j z_j^2} \left[\frac{\sum_j x_j z_j^2 X_j}{\sum_j x_j z_j^2} - X_i - \frac{\kappa^3}{2 \sum_j x_j z_j^2} \sum_j \left(\frac{x_j z_j^2}{1 + \kappa \sigma_j} \right) \right], \quad (\text{S18})$$

$$\ln \phi_i^{\text{Born}} = \frac{N_A e^2 z_i^2}{8\pi \epsilon_0 RT R_{B,i}} \left(\frac{1}{\epsilon_r} - 1 \right), \quad (\text{S19})$$

$$\ln \phi_i^{\text{Perm}} = \left[\frac{\kappa^2}{8\pi N_A \epsilon_r \sum_j x_j z_j^2} \sum_j \left(\frac{\kappa x_j z_j^2}{1 + \kappa \sigma_j} - \frac{x_j z_j^2}{R_{B,j}} \right) \right] N \left(\frac{\partial \epsilon_r}{\partial N_i} \right)_{T,V,N_j}. \quad (\text{S20})$$

Here, we need an expression for the variation of the dielectric constant with composition.

Relative Permittivity

To determine the relative permittivity contribution to the compressibility factor (Eq. ??) and to the fugacity coefficient (Eq. ??), one needs to evaluate the derivatives $\partial \epsilon_r / \partial V$ and $\partial \epsilon_r / \partial N_i$. We show how to obtain these derivatives from eCPA Eos and the relative permittivity primitive model from ?.[?] Assuming water as the only polar molecule in the mixture

with a net dipole moment, we can define function $F(\epsilon_r, \epsilon_\infty, N_i, V)$:

$$F(\epsilon_r, \epsilon_\infty, N_i, V) = \frac{(2\epsilon_r + \epsilon_\infty)(\epsilon_r - \epsilon_\infty)}{\epsilon_r(\epsilon_\infty + 2)^2} - \frac{N_A}{9\epsilon_0 k_B T v} x_w g_w \mu_{0w}^2 = 0. \quad (\text{S21})$$

The water Kirkwood g-factor and the probability of association between water and other molecules are given by:[?]

$$g_w = 1 + \frac{z_{ww} \mathcal{P}_{ww} \cos \gamma_{ww}}{\mathcal{P}_w \cos \theta_{ww} + 1}, \quad (\text{S22})$$

$$\mathcal{P}_w = \sum_j \mathcal{P}_{wj}, \quad (\text{S23})$$

$$\mathcal{P}_{wj} = \eta_{Aw} c x_j \chi_{Aw} \chi_{Bj} \delta_{Ai Bj}, \quad (\text{S24})$$

where η_{Aw} is the number of associating sites type A in water (2 for the 4C scheme).

To obtain the derivatives $\partial \epsilon_r / \partial V$ and $\partial \epsilon_r / \partial N_i$, we differentiate the function F :

$$dF = \left(\frac{\partial F}{\partial \epsilon_r} \right) d\epsilon_r + \left(\frac{\partial F}{\partial \epsilon_\infty} \right) d\epsilon_\infty + \left(\frac{\partial F}{\partial V} \right) dV + \sum_i \left(\frac{\partial F}{\partial N_i} \right) dN_i = 0. \quad (\text{S25})$$

To simplify the notation, we omit each term that is kept constant at each partial derivative. The dielectric constant derivatives can be expressed as:

$$V \left(\frac{\partial \epsilon_r}{\partial V} \right)_{T, N_i} = - \left(\frac{\partial F}{\partial \epsilon_r} \right)^{-1} \left[\left(\frac{\partial F}{\partial \epsilon_\infty} \right) V \left(\frac{\partial \epsilon_\infty}{\partial V} \right) + V \left(\frac{\partial F}{\partial V} \right) \right], \quad (\text{S26})$$

$$N \left(\frac{\partial \epsilon_r}{\partial N_i} \right)_{T, V, N_j} = - \left(\frac{\partial F}{\partial \epsilon_r} \right)^{-1} \left[\left(\frac{\partial F}{\partial \epsilon_\infty} \right) N \left(\frac{\partial \epsilon_\infty}{\partial N_i} \right) + N \left(\frac{\partial F}{\partial N_i} \right) \right]. \quad (\text{S27})$$

Each term of Eqs. (??) and (??) is given by the following expressions:

$$\left(\frac{\partial F}{\partial \epsilon_r} \right) = \frac{2\epsilon_r^2 + \epsilon_\infty^2}{\epsilon_r^2 (\epsilon_\infty + 2)^2}, \quad (\text{S28})$$

$$\left(\frac{\partial F}{\partial \epsilon_\infty} \right) = \frac{\epsilon_r \epsilon_\infty - 4\epsilon_\infty - 4\epsilon_r^2 - 2\epsilon_r}{\epsilon_r (\epsilon_\infty + 2)^3}, \quad (\text{S29})$$

$$V \left(\frac{\partial \epsilon_\infty}{\partial V} \right) = - \frac{3M_{\epsilon_\infty}}{(1 - M_{\epsilon_\infty})^2}, \quad (\text{S30})$$

$$N \left(\frac{\partial \epsilon_\infty}{\partial N_i} \right) = \frac{N_A c \alpha_{0i}}{\epsilon_0 (1 - M_{\epsilon_\infty})^2}, \quad (\text{S31})$$

$$V \left(\frac{\partial F}{\partial V} \right) = V \left(\frac{\partial F}{\partial V} \right)_{g_w} + \left(\frac{\partial F}{\partial g_w} \right) V \left(\frac{\partial g_w}{\partial V} \right) = \frac{N_A c x_w \mu_{0w}^2}{9\epsilon_0 k_B T} \left[g_w - V \left(\frac{\partial g_w}{\partial V} \right) \right], \quad (\text{S32})$$

$$N \left(\frac{\partial F}{\partial N_i} \right) = N \left(\frac{\partial F}{\partial N_i} \right)_{g_w} + \left(\frac{\partial F}{\partial g_w} \right) N \left(\frac{\partial g_w}{\partial N_i} \right) = - \frac{N_A c x_w \mu_{0w}^2}{9\epsilon_0 k_B T} \left[\frac{g_w \Gamma_{iw}}{x_w} + N \left(\frac{\partial g_w}{\partial N_i} \right) \right], \quad (\text{S33})$$

where $\Gamma_{ij} = 1$ if $i = j$, and $\Gamma_{ij} = 0$ otherwise, and

$$M_{\epsilon_\infty} = \frac{\epsilon_\infty - 1}{\epsilon_\infty + 2}. \quad (\text{S34})$$

Now we evaluate two special cases. In the first one, water is the only associating molecule and we can obtain an analytical expression for $\partial g_w / \partial V$ and $\partial g_w / \partial N_i$. In the second case, besides water self-association, we also have CO₂-H₂O cross-association, in such a way that numerical methods are used to obtain the derivatives of $\partial \chi_w / \partial V$ and $\partial \chi_w / \partial N_i$.

Special Case I: Water as single associating molecule

Assuming that $\varphi = V$, N or N if $\Phi = V$, N_w or N_c .

$$\varphi \left(\frac{\partial g_w}{\partial \Phi} \right) = \left(\frac{\partial g_w}{\partial \mathcal{P}_{ww}} \right) \left(\frac{\partial \mathcal{P}_{ww}}{\partial \chi_w} \right) \varphi \left(\frac{\partial \chi_w}{\partial \Phi} \right), \quad (\text{S35})$$

$$\mathcal{P}_w = \mathcal{P}_{ww} = 1 - \chi_w, \quad (\text{S36})$$

$$\left(\frac{\partial g_w}{\partial \mathcal{P}_{ww}} \right) = \frac{g_w - 1}{\mathcal{P}_{ww} (\mathcal{P}_{ww} \cos \theta_{ww} + 1)}, \quad (\text{S37})$$

$$\left(\frac{\partial \mathcal{P}_{ww}}{\partial \chi_w} \right) = -1, \quad (\text{S38})$$

$$V \left(\frac{\partial \chi_w}{\partial V} \right) = \frac{1}{4c x_w \delta} \left(\frac{1 + 4c x_w \delta}{\sqrt{1 + 8c x_w \delta}} - 1 \right) \left(1 + \frac{\eta}{g_\eta} \frac{dg_\eta}{d\eta} \right), \quad (\text{S39})$$

$$N \left(\frac{\partial \chi_w}{\partial N_i} \right) = \frac{1}{4cx_w\delta} \left(1 - \frac{1 + 4cx_w\delta}{\sqrt{1 + 8cx_w\delta}} \right) \left(\frac{\Gamma_{iw}}{x_w} + \frac{cb_i}{4g_\eta} \frac{dg_\eta}{d\eta} \right). \quad (\text{S40})$$

Special Case II: Water self-association + CO₂ cross-association

$$\mathcal{P}_w = \mathcal{P}_{ww} + \mathcal{P}_{wc}, \quad (\text{S41})$$

$$\mathcal{P}_{ww} = 2cx_w\chi_w^2\delta_w, \quad (\text{S42})$$

$$\mathcal{P}_{wc} = 2cx_c\chi_w\chi_c S_{cw}\delta_w, \quad (\text{S43})$$

$$\begin{aligned} \varphi \left(\frac{\partial g_w}{\partial \Phi} \right) &= \left(\frac{\partial g_w}{\partial \mathcal{P}_{ww}} \right) \varphi \left(\frac{\partial \mathcal{P}_{ww}}{\partial \Phi} \right) + \left(\frac{\partial g_w}{\partial \mathcal{P}_w} \right) \varphi \left(\frac{\partial \mathcal{P}_w}{\partial \Phi} \right) \\ &= \frac{g_w - 1}{\mathcal{P}_{ww}} \varphi \left(\frac{\partial \mathcal{P}_{ww}}{\partial \Phi} \right) + \frac{(g_w - 1) \cos \theta_{ww}}{\mathcal{P}_w \cos \theta_{ww} + 1} \left[\varphi \left(\frac{\partial \mathcal{P}_{ww}}{\partial \Phi} \right) + \varphi \left(\frac{\partial \mathcal{P}_{wc}}{\partial \Phi} \right) \right]. \end{aligned} \quad (\text{S44})$$

$\mathcal{P}_{ww} = f(N_w, V, \delta_w, \chi_w)$, whereas $\mathcal{P}_{wc} = f(N_c, V, \delta_w, \chi_w, \chi_c)$. Their derivatives with respect of V and N_i are then given, respectively, by:

$$V \frac{\partial \mathcal{P}_{ww}}{\partial V} = \mathcal{P}_{ww} \left[-1 + \frac{\delta_w \eta}{g_\eta} \frac{dg_\eta}{d\eta} + \frac{2}{\chi_w} V \left(\frac{\partial \chi_w}{\partial V} \right) \right], \quad (\text{S45})$$

$$V \frac{\partial \mathcal{P}_{wc}}{\partial V} = \mathcal{P}_{wc} \left[-1 + \frac{\delta_w \eta}{g_\eta} \frac{dg_\eta}{d\eta} + \frac{1}{\chi_w} V \left(\frac{\partial \chi_w}{\partial N_i} \right) + \frac{1}{\chi_c} V \left(\frac{\partial \chi_c}{\partial N_i} \right) \right], \quad (\text{S46})$$

$$N \frac{\partial \mathcal{P}_{ww}}{\partial N_i} = \mathcal{P}_{ww} \left[\frac{\Gamma_{iw}}{x_w} + \frac{\delta_w \eta b_i}{g_\eta b} \frac{dg_\eta}{d\eta} + \frac{2}{\chi_w} N \left(\frac{\partial \chi_w}{\partial N_i} \right) \right], \quad (\text{S47})$$

$$N \frac{\partial \mathcal{P}_{wc}}{\partial N_i} = \mathcal{P}_{wc} \left[\frac{\Gamma_{ic}}{x_c} + \frac{\delta_w \eta b_i}{g_\eta b} \frac{dg_\eta}{d\eta} + \frac{1}{\chi_w} N \left(\frac{\partial \chi_w}{\partial N_i} \right) + \frac{1}{\chi_c} N \left(\frac{\partial \chi_c}{\partial N_i} \right) \right]. \quad (\text{S48})$$

The derivatives of χ_i with respect to V and N_i are obtained numerically. First, we define two functions G and H :

$$G(\chi_w, \chi_c, \delta_w, V, N_w) = \chi_c - \frac{V}{V + 2N_w\chi_w S_{cw}\delta_w} = 0, \quad (\text{S49})$$

$$H(\chi_w, \chi_c, \delta_w, V, N_w, N_c) = \chi_w - \frac{V}{V + 2N_w\chi_w\delta_w + 2N_c\chi_c S_{cw}\delta_w} = 0, \quad (\text{S50})$$

$$dG = \left(\frac{\partial G}{\partial \chi_w} \right) d\chi_w + \left(\frac{\partial G}{\partial \chi_c} \right) d\chi_c + \left(\frac{\partial G}{\partial \delta_w} \right) d\delta_w + \left(\frac{\partial G}{\partial V} \right) dV + \left(\frac{\partial G}{\partial N_w} \right) dN_w = 0, \quad (\text{S51})$$

$$dH = \left(\frac{\partial H}{\partial \chi_w} \right) d\chi_w + \left(\frac{\partial H}{\partial \chi_c} \right) d\chi_c + \left(\frac{\partial H}{\partial \delta_w} \right) d\delta_w + \left(\frac{\partial H}{\partial V} \right) dV + \left(\frac{\partial H}{\partial N_w} \right) dN_w + \left(\frac{\partial H}{\partial N_c} \right) dN_c = 0, \quad (\text{S52})$$

$$\varphi \left(\frac{\partial \chi_c}{\partial \Phi} \right) = - \left(\frac{\partial G}{\partial \chi_c} \right)^{-1} \left[\left(\frac{\partial G}{\partial \chi_w} \right) \varphi \left(\frac{\partial \chi_w}{\partial \Phi} \right) + \left(\frac{\partial G}{\partial \delta_w} \right) \varphi \left(\frac{\partial \delta_w}{\partial \Phi} \right) + \varphi \left(\frac{\partial G}{\partial \Phi} \right) \right], \quad (\text{S53})$$

$$\varphi \left(\frac{\partial \chi_w}{\partial \Phi} \right) = - \left(\frac{\partial H}{\partial \chi_w} \right)^{-1} \left[\left(\frac{\partial H}{\partial \chi_c} \right) \varphi \left(\frac{\partial \chi_c}{\partial \Phi} \right) + \left(\frac{\partial H}{\partial \delta_w} \right) \varphi \left(\frac{\partial \delta_w}{\partial \Phi} \right) + \varphi \left(\frac{\partial H}{\partial \Phi} \right) \right]. \quad (\text{S54})$$

We have three new unknowns: $\partial \chi_w / \partial V$, $\partial \chi_w / \partial N_w$, and $\partial \chi_w / \partial N_c$ that can be solved numerically by coupling Eqs. ?? and ??, knowing that $\partial \chi_c / \partial N_c = 0$. All the other derivatives are given next:

$$\left(\frac{\partial G}{\partial \chi_w} \right) = 2x_w c S_{cw} \delta_w \chi_w^2, \quad (\text{S55})$$

$$\left(\frac{\partial G}{\partial \chi_c} \right) = 1, \quad (\text{S56})$$

$$\left(\frac{\partial G}{\partial \delta_w} \right) = -\chi_c^2 [1 + 2x_w c S_{cw} \chi_w (\delta_w - 1)], \quad (\text{S57})$$

$$\left(\frac{\partial H}{\partial \chi_w} \right) = 1 + 2x_w c \delta_w \chi_w^2, \quad (\text{S58})$$

$$\left(\frac{\partial H}{\partial \chi_c} \right) = 2x_c c S_{cw} \delta_w \chi_c^2, \quad (\text{S59})$$

$$\left(\frac{\partial H}{\partial \delta_w} \right) = -\chi_w^2 [1 + (2x_w c \chi_w + 2x_c c S_{cw} \chi_w) (\delta_w - 1)], \quad (\text{S60})$$

$$V \left(\frac{\partial G}{\partial V} \right) = -2x_w c S_{cw} \delta_w \chi_w^3, \quad (\text{S61})$$

$$V \left(\frac{\partial H}{\partial V} \right) = -\chi_w^2 (2x_w c \delta_w \chi_w + 2x_c c S_{cw} \delta_w \chi_c), \quad (\text{S62})$$

$$V \left(\frac{\partial \delta_w}{\partial V} \right) = -\frac{\delta_w \eta}{g_\eta} \frac{dg_\eta}{d\eta}, \quad (\text{S63})$$

$$N \left(\frac{\partial G}{\partial N_w} \right) = 2c S_{cw} \delta_w \chi_w^3, \quad (\text{S64})$$

$$N \left(\frac{\partial H}{\partial N_w} \right) = 2c \delta_w \chi_w^3, \quad (\text{S65})$$

$$N \left(\frac{\partial H}{\partial N_c} \right) = 2c S_{cw} \delta_w \chi_w^2 \chi_c, \quad (\text{S66})$$

$$N \left(\frac{\partial \delta_w}{\partial N_i} \right) = \frac{\delta_w \eta b_i}{g_\eta b} \frac{dg_\eta}{d\eta}. \quad (\text{S67})$$

Figure S5: Density of CO₂-water mixture in the aqueous phase below the saturation point *vs.* CO₂ concentration at various temperatures (the legend in the subplot (a) holds for all others) and various pressures (a-e) from CPA EoS (continuous line) and experiments⁷ (discrete points).

Figure S6: Density of the aqueous and CO₂-rich phases at equilibrium in the CO₂-H₂O mixture at various temperatures from GEMC simulations and CPA EoS. "LB" and "OPT" stand for Lorentz-Berthelot and optimized (at lower temperatures[?]) unlike parameters between CO₂-H₂O molecules, respectively.

Figure S7: Phase diagram of the $\text{CO}_2\text{-H}_2\text{O}$ mixture at various temperatures from GEMC simulations and experiments^{???} for various classical force field combinations: SPCE-EPM2 (results from This Work using "OPT" unlike parameters), Exp6-Exp6,[?] SPC-EPM2,[?] TIP4P-EPM2,[?] TIP4P2005-EPM2,[?] TIP4P2005-Trappe.[?]

Figure S8: Phase diagram of the $\text{CO}_2\text{-H}_2\text{O}$ mixture at $T = 573$ K from GEMC simulations and experiments^{???} for various polarizable force field combinations: HBP-GPC,[?] GCP-GPC[?] and BK3-GPC.[?] We also show the results from the classical force field SPCE-EPM2 (results from This Work using "OPT" unlike parameters).

CO₂-Brine Mixture

Figure S9: CO₂ solubility in NaCl brine from low to moderate temperatures ($T < 500 \text{ K}$), various pressures and salinities of 1 and 5 mol.kg⁻¹ from eCPA EoS (continuous line) and experiments^{???} (discrete points).

Figure S10: CO₂ solubility in NaCl brine at various temperatures (a-l) from eCPA models (This Work in continuous lines and DTU⁷ in dashed lines) and experiments (discrete points).

Figure S11: Density of the aqueous phase in the CO₂-brine mixture below CO₂ saturation *vs.* CO₂ concentration at various pressures, salinities and two different pressures (a-b) from eCPA EoS (continuous line) and experiments[?] (discrete points).

Figure S12: CO₂ solubility in the CO₂-rich phase in the CO₂-brine mixture *vs.* salt concentration at various pressures and two different temperatures from GEMC simulations and eCPA EoS. "LB" and "OPT" stand for Lorentz-Berthelot and optimized (at lower temperatures[?]) unlike parameters between CO₂-H₂O molecules, respectively.

Figure S13: Density of the CO₂-saturated NaCl brine *vs.* salt concentration at various pressures and two different temperatures from GEMC simulations and eCPA EoS. "LB" and "OPT" stand for Lorentz-Berthelot and optimized (at lower temperatures[?]) unlike parameters between CO₂-H₂O molecules, respectively.

Association

Figure S14: Scheme of the radial distribution function between the water-oxygen and water hydrogen, CO₂-oxygen and water-hydrogen, and water-oxygen and CO₂-carbon. The vertical dashed line represents the cutoff for the hydrogen bond criteria ($r = 2.4 \text{ \AA}$).

Figure S15: Association (χ_w) and cross-association (χ_c) in the CO₂-water mixture *vs.* temperature at various pressures in (a) aqueous phase ($x_c = 0.04$) and (b) CO₂-rich phase ($x_c = 0.80$) from MD simulations. "LB" and "OPT" stand for Lorentz-Berthelot and optimized (at lower temperatures[?]) unlike parameters between CO₂-H₂O molecules, respectively.

(a) $x_c = 0.04$

(b) $x_c = 0.80$

Figure S16: Association ratio between the number of associating CO_2 (N_c^*) and the number of associating H_2O (N_w^*) from MD simulations (discrete points) and CPA EoS (continuous line) in (a) aqueous phase ($x_c = 0.04$) and (b) CO_2 -rich phase ($x_c = 0.80$).
